## ABSTRACT

COVID-19 induced pandemic situations have put the bio-medical waste (BMW) management system, of the world, to test. Sudden influx, of COVID-infected patients, in health-care facilities, has increased the generation of yellow category BMW (Y-BMW) and put substantial burden on the BMW-incineration units of India. This study presents the compromising situation of the BMW-incineration units of India, in the wake of COVID-19 pandemic, from 21st March 2020 to 31st August 2020. This analysis revealed that on an average each COVID-infected patient in India generates approximately 3.41 kg/d of BMW and average proportion of Y-BMW in it is 50.44%. Further, it was observed that on 13th July 2020, the total Y-BMW, generated by both the normal and COVID-infected patients, fully utilized the BMW-incineration capacity of India. Also, it was made evident that, during the study period, BMW-incineration emitted several pollutants and their concentration was in the order:  $\text{NO}_x > \text{CO} > \text{SO}_x > \text{PM} > \text{HCl} > \text{Cd} > \text{Pb} > \text{Hg} > \text{PCBs} > \text{Ni} > \text{Cr} > \text{Be} > \text{As}$ . Subsequently, life time cancer risk assessment depicted that with hazard quotient  $>106$ , Cd may induce carcinogenic health impacts on both the adults and children of India. Therefore, to mitigate the environmental-health impacts associated with the incineration of BMW, evaluation of various options, viz., alternative technologies, substitution of raw materials and separate treatment of specific wastes, was also done. It is expected that the findings of this study may encourage the global auditory comprising scientific community and authorities to adopt alternate BMW-management strategies during the pandemic.

## ABSTRACT

The objective of this project book is to apply the concept of Dry excavations are common in urban areas, nearby existing constructions. The support systems have the main function of preserve the stability and control soil displacements close to the excavation. Settlement control of nearby structures is an essential aspect during design and construction. Settlements prediction is usually made by empirical methods and in some cases also by numerical modelling. The paper presents a numerical modelling of a dry excavation by Plaxis program. The program allows the prediction of stress and deformation behaviour of different geotechnical constructions using the Finite Element Method. The excavation has been modelled in five stages, in order to reproduce the construction phases. The numerical modelling was capable to reproduce satisfactorily the horizontal profile of the displacements of the diaphragm wall. In relation to settlements, the shape of the settlement profile was quite similar. in economical point of aspect

Hence, the experimental investigation and numerical study on Dry excavation is done using basis of excavation studies.

**Keywords:** Staged construction, Diaphragm wall, Interface (rigid, flexible), Anchor (node-node), Closed Flow boundary, Deep excavations, Settlements, Stress, Numerical Modelling, Plaxis

## **ABSTRACT**

In the recent years, due to the uncertain climatic variations, natural calamities and other issues like the price of the crop has varied to a larger level. Farmers are uninformed of these uncertainties, which cause massive loss. The developing Crop Price Forecasting System is a well-designed System which provides accurate results in predicting price for the selected crops in a particular market. In this process there are three actors, The Administrator, The Agricultural Department and end user.

The Admin maintains the entire System, The Departments and end users can view the Price Prediction. For this problem, we are using the supervised machine learning Algorithm for price prediction, So the end users can view prices for their selected crops in a particular market before sowing. The Parameters considered for Price Prediction are- State, District, Market name, Commodity, Crop Arrival Date, Rainfall and Minimum support price (MSP). The algorithm which we are using Random forest regressor, decision tree regressor and support vector regressor, among the algorithms Random forest regressor has the highest accuracy by using this method the end users are able to get a right price for their crops in the market.

## ABSTRACT

In fast forward world of technology, everyone is running behind the mobile application and they need all the information on the mobile phone itself. The elderly population poses dramatic challenges in the public healthcare domain. Adoption of an efficient and yet highly reliable automatic fall detection system may not only mitigate the adverse effects of falls through immediate medical assistance but also profoundly improve the functional ability and confidence level of elder people. This application has been introduced to help the falling person with an immediate alert to the neighbour contacts and give live location and information about the user. The neighbours can easily get to know whether the user is really seeking help. By using the application, neighbour can help the nearest user.

This application has add-on option giving hospitals location to help the suffering user. When user is about to fall some amount of pressure has been given to mobile phone through which the application gathers the pressure information by using accelerometer sensor. Once the accelerometer start getting the pressure count it immediately turn on the alarm screen, after 30 seconds of alarm screen an alert message will be sent to user's emergency contact list. So that the user can seek immediate help from their neighbours. This concept is most helpful for the older people. This application will be user-friendly. The motivation of this application isto reduce the falling count of human beings and to help the society.

## ABSTRACT

The easy of the accessibility of Internet and the popularity of Machine Learning have been the prime reasons in the increase of prediction in many areas. COVID 19 pandemic is caused by coronavirus is continuously spreading until now all over the world. This impact is already fallen on all sectors of development. Many precautionary had been taken to reduce the spread of coronavirus. Wearing mask in all places is the primary measure take by the government to reduce the spread of virus and also many institutions and schools were to be opened. In this project we proposed a system that avoids spread of corona virus by finding out people who are not wearing face mask in the institution or in a public place are monitored by a camera. While a person is selected without a mask, the corresponding authority is informed through college network and also gives warning tones. A deep learning architecture is trained on a dataset that consists of people with and without mask collected from various sources. The trained architecture achieves 99% accuracy on monitoring people with and without mask without fail. With the above system an IR temperature monitoring system is embedded to monitor the body temperature of each individual person without touching. Hope our study would be useful to reduce the spread of COVID-19 virus.

## ABSTRACT

Internet of Things (IoT) conceptualizes the idea of remotely connecting and monitoring real world objects (things) through the Internet. When it comes to our class rooms, this concept can be aptly incorporated to make it smarter, safer and automated. Smart classroom is the representative of the modern teaching. With the advent of modern technology, it becomes easier for the students as well as teachers to perform their task more efficiently. With the aid of modern technology, it has become easier for the students and teachers across the world to get a good grasp of the theoretical as well as practical knowledge.

This IoT project focuses on building a smart classroom system. In this project, we present such a system where classroom hold interactions is made easier by implementing automation and security along with the Internet of Things. The main goal of this project is to provide an efficient learning environment. The model of the smart classroom has been integrated by connecting the PIC microcontroller with LCD display. This model will bring the automation in the attendance, doors will automatically open & close and finally the lights and fans in the classroom are started to operate automatically, When the student enter into the classrooms.

## ABSTRACT

This project work explores the characteristics of mechanical and thermal insulation properties of a Bamboo E-Glass Reinforced Composite (BERC). Bamboo fiber extraction is process completed under chemical treatment of sodium hydroxide (NaOH). The collected fibers are used to fabricate composite material trapped in various fiber volume fractions of thermoset resins (Polyester). There are three variations in fiber volume fraction, the first specimen, Bamboo fiber and E-Glass fiber trapped 40% and 10% respectively. Second specimen Bamboo fiber and E-Glass fiber trapped 40% and 20% respectively. And the third specimen Bamboo fiber and E-Glass fiber trapped 40% and 30% respectively. Composite made up with 7 layers and different angle orientation. Plates of these fibers are made with a compression molding machine to investigate the mechanical properties, these specimens were subjected to tensile, shear, flexural, impact, hardness, and water absorption tests. The Guarded Heat Flow Meter Method reveals the thermal insulation property.

**Keywords:** Bamboo fibre, E-Glass fibre, NaOH, Polyester.

## ABSTRACT

From decades, natural fibers in the form of reinforcements in polymer composites have been a test subject for scientists because of its growing familiarity wide range of applications. Now a day's polymeric materials are used in almost all the applications because of their specific characteristics such as light weight, selflubrication capability and reduced noise. Composite materials with thermoplastic matrices and a reinforcement of natural fibers are increasingly regarded as an alternative to material replacement for various applications. The substitution of the traditionally used composite of natural fibers such as sisal, banana and jute can lead to a reduction of the component's weight and furthermore to a significant improvement of specific properties like tensile strength, Flexural strength, Shear Strength, Thermogravimetric analysis and Vibration Strength . Natural fibers, as reinforcement, have recently attracted the attention of researchers because of their advantages over other established materials. They are environmentally-friendly, fully biodegradable, abundantly available, non-toxic, non-abrasive, renewable, and cheap, and have low density. In this project , we have to find the different method for to improve the vibration characteristics natural fibers.

## **ABSTRACT**

During different time era's different methods of communications has developed and changed the everyday life. Video marketing and social media has become the way of communication in the 21st-century, enabling us to express our thoughts, ideas and feelings in a complete new way. This way of communication have also had a huge impact on corporations, where they have realized that without a proper plan and Video marketing and social media strategy they have no chance to stand out in the rapidly changing digital space.

To ensure a successful presence on Video marketing and social media the companies need to take different marketing theories into consideration so that they can boost their brand in diverse aspects. If this can be combined with innovative ways of consumer interaction the companies have a good chance to take the lead in Video marketing and social media marketing. To solve the problem with measuring the return on investment, companies such as HP Sweden, can implement tools like Video marketing and social media monitoring. With these tools they will be able to analyze and measure their brand or products on the social space enabling them to optimize their way of marketing.
